

Medical Oncology: Dynamic, Challenging and Rewarding

Training in medical oncology involves rotating through and learning about the management of all the major types of cancer. This includes becoming competent in the supervision of systemic treatments, which incorporates chemotherapy, endocrine therapy and newer and exciting biological agents such as antibodies and immunotherapy. Furthermore, with the multi-disciplinary approach of cancer care, trainees learn the complex care pathways and multi-modality nature of treatments by working within a large team.

“

I love medical oncology because it is a particularly exciting time with the expansion of targeted and immunotherapies. We have the opportunity to use these cutting edge treatments for patient benefit.

There have been dramatic improvements in treatment and I'm excited to see that continuing ”

Dr Eileen Parkes, Academic Clinical Lecturer & Medical Oncology Trainee
